Hand only gear change ● Provides automatic control of clutch on manual vehicles ●  
 No modification to original vehicle parts ● Can be fitted to most vehicles ● Vehicle can  
 be driven conventionally ● Infrared sensor or button on gear knob

## 932 Syncrodrive Semi-automatic Clutch System

The 'Syncrodrive' semi-automatic clutch system removes completely the requirement for the left leg during gear change in a manual vehicle. An infrared sensor (or button) on the gear knob detects the hand when changing gear and performs completely the operation of the clutch for the driver. Extremely suitable where an automatic version of a vehicle is not available. The microprocessor controlled system monitors the vehicle speed, rpm, braking and acceleration and is virtually impossible to stall. Once fitted the ECU can be set-up by the fitter using a hand held keypad to adjust the system for the individuals' driving technique, even to those settings required in high performance race cars.
